Singtel – Churn risk for the 20% outreach list

Question. Which customers should the retention team call this quarter, given capacity for about 20% of the base, and do contact-centre transcripts improve that list?

**Answers*

1. Calling the top 20% by model score reaches **53% of churners at 70% precision, 2.6× a random list** - This is basedon test set
2. Churn sits in month-to-month fibre customers in their first year. **98.6% of the 20% list is month-to-month** and 83% is fibre.
3. Among callers: caller-churners on the list rise from **37 to 48 of 65**.

Churn Reason	share_of_churners
Competitor	33.2%
Product / network	22.8%
Support experience	19.6%
Price	13.0%
Unknown	8.2%
Not saveable	3.2%

observations

Contract is the dominant split. Month-to-month churns 42.7%, one-year 11.3%, two-year 2.8%. 55% of customers are month-to-month. **Churn is front-loaded.** 52.9% of customers in their first 6 months churn, falling to 9.5% after 4 years. Median tenure is 10 months for churners and 38 for those who stay. **Fibre churns at twice the DSL rate** (41.9% vs 19.0%) at a higher bill. The combination matters more than either alone: month-to-month fibre in months 0-6 churns 74.2% (619 customers). **Electronic-check payers churn 45.3%**, against 15-19% for every other method. Likely a proxy for lower commitment (no auto-pay), not a cause.

Churners pay more: $74 a month on average vs $61 for those who stay, so the list protects above-average revenue. **Recorded reasons:** competitor offers 33%, product/network 23%, support experience 20%, price 13%. Only 3% (moved, deceased) are outside the company's control.

2. Model development

Split. One stratified 75/25 split (seed 270), reused by every model in this notebook, including the transcript model. Hyper-parameter and design choices use 5-fold cross-validation on the training set only; the test set is scored once per model.

In [23]:
```
X = build_tabular(customers)
y = customers.set_index("CustomerID")["churn"]
train_ids, test_ids = make_split(customers)
X_tr, X_te, y_tr, y_te = X.loc[train_ids], X.loc[test_ids],
y.loc[train_ids], y.loc[test_ids]
print(f"train {len(train_ids):,} ({y_tr.mean():.1%} churn) | test
{len(test_ids):,} ({y_te.mean():.1%} churn)")
print(f"20% of the test set = {round(0.2*len(test_ids))} customers")
```

```
train 5,282 (26.5% churn) | test 1,761 (26.5% churn)
20% of the test set = 352 customers
```

2.1 Algorithm and class imbalance

regularised logistic regression (one-hot categoricals, scaled numerics) and LightGBM (handles interactions without manual crosses). Churn is 26.5%, so the imbalance is moderate.

In [24]:
```
spw = (y_tr == 0).sum() / (y_tr == 1).sum()
candidates = {
    "Logistic, no weighting": lambda: logistic_pipeline(X_tr,
class_weight=None),
    "Logistic, class-weighted": lambda: logistic_pipeline(X_tr,
class_weight="balanced"),
    "LightGBM, no weighting": lambda: lgbm_model(None),
    "LightGBM, class-weighted": lambda: lgbm_model(spw),
}
cv_rows = {}
for name, make in candidates.items():
    _, folds = cross_validate(make, X_tr, y_tr)
    cv_rows[name] = folds.mean()
cv = pd.DataFrame(cv_rows).T[["recall@20", "precision@20", "lift@20",
"pr_auc", "roc_auc", "accuracy@0.5"]]
cv.style.format("{:.3f}").highlight_max(color="#F4C7CF")
```

Out[24]:

	recall@20	precision@20	lift@20	pr_auc	roc_auc	accuracy@0.5
Logistic, no weighting	0.524	0.696	2.621	0.680	0.858	0.816
Logistic, class-weighted	0.524	0.696	2.621	0.679	0.858	0.761
LightGBM, no weighting	0.511	0.680	2.560	0.680	0.860	0.809
LightGBM, class-weighted	0.512	0.681	2.564	0.683	0.860	0.764

Choice: Logistic regression without class-weights as it beats the lightgbm in top 20%

In [25]:
```
tab_model = logistic_pipeline(X_tr, class_weight="balanced").fit(X_tr,
y_tr)
p_tab = tab_model.predict_proba(X_te)[:, 1]
challenger = lgbm_model(spw).fit(X_tr, y_tr)
p_lgb = challenger.predict_proba(X_te)[:, 1]

test_metrics = pd.DataFrame({"Logistic (chosen)": evaluate(y_te, p_tab),
                             "LightGBM (challenger)": evaluate(y_te,
p_lgb)}).T
test_metrics[["accuracy@0.5", "recall@20", "precision@20", "lift@20",
"churners_caught", "pr_auc", "roc_auc"]].style.format(
    {"accuracy@0.5": "{:.1%}", "recall@20": "{:.1%}", "precision@20": "
{:.1%}", "lift@20": "{:.2f}x",
     "churners_caught": "{:.0f}", "pr_auc": "{:.3f}", "roc_auc": "

2.3 Does Total Charges make sense?

In [27]:
```
X_tc = build_tabular(customers, t0_safe=False)
p_tc = logistic_pipeline(X_tc.loc[train_ids]).fit(X_tc.loc[train_ids],
y_tr).predict_proba(X_tc.loc[test_ids])[:, 1]
pd.DataFrame({"Chosen (no Total Charges)": at_capacity(y_te, p_tab),
              "Adding Total Charges, avg billed, bill rise":
at_capacity(y_te, p_tc)}).T.round(3)
```

Out[27]:

	precision@20	recall@20	lift@20	churners_caught	contacted
Chosen (no Total Charges)	0.699	0.527	2.635	246.0	352.0
Adding Total Charges, avg billed, bill rise	0.693	0.522	2.614	244.0	352.0

Dropping Total Charges and the two fields changes nothing in terms of recall , They are left out of the chosen model

2.4 Tenure measured after T0

In [28]:
```
# Tenure is as of each customer's last account update, not T0.
# Check: every stayer's tenure covers first call -> 30 Jun; churners'
stops at the date they left.
END = pd.Timestamp("2026-06-30")
calls_raw = load_raw_calls().assign(cid=lambda d:
d.customer_id.astype(str).str.strip().str.upper())

No tenure at all	1,761	46.9%	62.2%	2.35x	0.838

3. Evaluation

Accuracy at a 0.5, The retention team will call the top 20% by score

Recall@20%: share of all churners that land on the call list (how much churn we can reach). **Precision@20%**: share of the list that would have churned (how much of the call budget is spent on real risk). **Lift@20%**: precision divided by the base rate (vs calling at random).

Recall and precision at 20% move together here

In [29]:

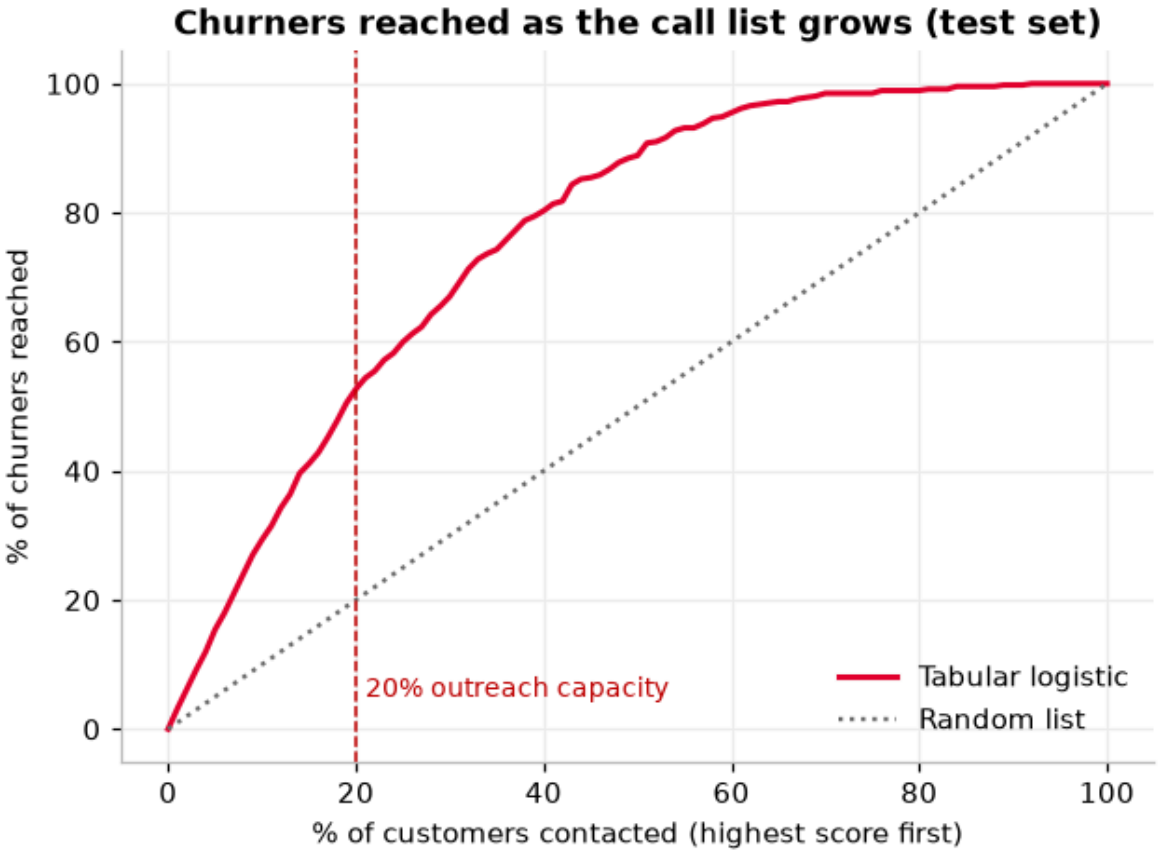

```
lo, hi = bootstrap_ci(y_te, p_tab, "recall@20")
m = at_capacity(y_te, p_tab)
print(f"Top 20% = {m['contacted']} customers; {m['churners_caught']} of
{int(y_te.sum())} churners "
      f"(recall {m['recall@20']:.1%}, 95% CI {lo:.1%}–{hi:.1%});
precision {m['precision@20']:.1%}; "
      f"lift {m['lift@20']:.2f}x; a random list would reach
{0.2*y_te.sum():.0f}.")

caps = pd.DataFrame([{"capacity": k, **{kk: v for kk, v in
at_capacity(y_te, p_tab, k).items()
                                        if kk in ("contacted",
"churners_caught")}} for k in (0.1, 0.2, 0.3, 0.4)])
caps["recall"] = caps.churners_caught / y_te.sum(); caps["precision"] =
caps.churners_caught / caps.contacted
caps["extra churners per extra 1% of base"] = caps.churners_caught.diff()

5. analysis: contact-centre transcripts

A call is usable only if the retention team could have seen it on that date.

In [33]:
```
raw_calls = load_raw_calls()
calls, set_aside, call_audit = load_calls(ids)
print(f"Raw extract: {len(raw_calls):,} calls,
{raw_calls.customer_id.str.strip().str.upper().nunique():,} customer
IDs")
```

```
display(pd.DataFrame(call_audit, columns=["Step", "Calls"]))
print(f"Usable: {len(calls):,} calls from {calls.customer_id.nunique():,}
customers "
      f"({calls.customer_id.nunique()/len(customers):.1%} of the base);
{calls.is_stub.sum()} of them have no usable text")
```

```
Raw extract: 2,353 calls, 908 customer IDs
```

	Step	Calls
0	customer_id had leading/trailing spaces (fixed...	47
1	Customer ID not in customer file (orphan)	8
2	After scoring date T0 2026-03-31 (not observable)	946
3	Duplicate log of the same call	17
4	Empty or stub transcript ([call disconnected],...	38

```
Usable: 1,382 calls from 724 customers (10.3% of the base); 38 of them have no usable text
```

In [34]:
```
# cancellation calls can go: as the customer is already decided to churn
or churned
post =
raw_calls.assign(cid=raw_calls.customer_id.str.strip().str.upper())
post = post[post.interaction_date > T0].merge(customers[["CustomerID",
"churn"]], left_on="cid", right_on="CustomerID")
term = post[post.call_type == "Termination Request"]
print(f"Post-T0 Termination Request calls: {len(term)}; resolved as
'Account Closed': {(term.resolution_status=='Account Closed').sum()}; "
      f"customer churned: {term.churn.mean():.0%}")
display(pd.crosstab(post.call_type, post.churn,
normalize="index").rename(columns={0: "stayed", 1: "churned"})
          .sort_values("churned", ascending=False).head(5).style.format("
{:.0%}"))
```

```
Post-T0 Termination Request calls: 266; resolved as 'Account Closed': 256; customer churned: 96%
```

churn	stayed	churned
call_type		
Termination Request	4%	96%
Number Porting Enquiry	22%	78%
Retention Offer Discussion	31%	69%
Complaint / Escalation	60%	40%
Contract Enquiry	74%	26%

This is the main leakage trap in the extract. The workbook runs to 2026-06-30, three months past T0. After T0, 266 termination calls appear and 256 of them are closed as "Account Closed" on that same call: these are the cancellations themselves, recorded inside the outcome window. A model allowed to see them would look excellent and be useless on the scoring date. All 946 post-T0 calls are set aside; they are used only in section 5.3 to measure how early churners call.

In [35]:
```
# Bias checks on what remains (pre-T0 only)
pre = calls.merge(customers[["CustomerID", "churn"]],
left_on="customer_id", right_on="CustomerID")
cust_rate = pre.drop_duplicates("customer_id").churn.mean()
```

```
print(f"Callers churn {cust_rate:.1%} vs {customers.churn.mean():.1%} for
the base: calling is itself a signal.")
display(pre.groupby("channel").agg(calls=("churn", "size"), churn=
("churn", "mean"))
           .style.format({"churn": "{:.1%}"}))
display(pd.crosstab(pre.call_type, pre.channel).loc[["Retention Offer
Discussion", "Plan Change Request"]])
print(f"CSAT surveyed on {pre.csat.notna().mean():.0%} of calls; agent
turns repeat: "
      f"{pd.Series([l for t in pre.transcript.dropna() for l in
t.split(chr(10)) if l.startswith('Agent')]).duplicated().mean():.0%} "
      "of agent lines are verbatim repeats of another call")
```

```
Callers churn 37.7% vs 26.5% for the base: calling is itself a signal.
```

channel	calls	churn
Inbound Voice	1296	37.2%
Outbound Voice	86	46.5%

call_type	channel	Inbound Voice	Outbound Voice
Retention Offer Discussion		5	15
Plan Change Request		216	15

```
CSAT surveyed on 57% of calls; agent turns repeat: 64% of agent lines are verbatim repeats of another call
```

5.2 Representation: features plus a text score

In [36]:
```
calls = prepare_call_text(calls)
ex = calls[calls.customer_text.str.len() > 0].iloc[0]
print("RAW:\n", ex.transcript[:600], "\n\nCUSTOMER TEXT AFTER
CLEANING:\n", ex.customer_text)
```

```
RAW:
 Agent: You're speaking with Pavel. Sorry about the wait, we're a bit busy this morning. How can I help?
Customer: sort of, i'd like to add a service. What does Device Protection cost these days?
Agent: Right, I see. And [pause] has anyone looked at this for you previously?
Customer: basically, okay good. I just wanted to be sure.
Agent: It's included in your current package at no extra charge.
Customer: Understood. Can you email that to me as well?
Agent: That's right. Nothing further needed from you. I can put a temporary hold on the charge while we investigate. Reference is
REF-573816. Is th

CUSTOMER TEXT AFTER CLEANING:
 i'd to add a service what does device protection cost these days okay good i just wanted to be sure understood can you email that
to me as well that covers it thank you
```

In [37]:
```
seq = sequence_features(calls, X.index)
text_oof = out_of_fold_text_risk(calls, list(train_ids), y_tr)
text_scorer = TextRiskScorer().fit(calls, list(train_ids), y_tr)
text_te = text_scorer.score(calls, list(test_ids))

from sklearn.metrics import roc_auc_score
print(f"Callers with text: train {text_oof.notna().sum()}, test
{text_te.notna().sum()}")
print(f"Text-only AUC among callers: train OOF
{roc_auc_score(y_tr[text_oof.notna()], text_oof.dropna()):.3f}, "
      f"test {roc_auc_score(y_te[text_te.notna()],
text_te.dropna()):.3f}")
pos_terms, neg_terms = text_scorer.top_terms(12)
display(pd.concat([pos_terms.add_prefix("churn_"),
neg_terms.add_prefix("stay_")], axis=1).round(2))
```

```
Callers with text: train 550, test 164
Text-only AUC among callers: train OOF 0.789, test 0.763
```
